Polyaminooquinones were synthesized by the interaction
of chloranil with benzidine or hexamethylenediamine.
Polymerhomologous conversions are possible because
of the mobile halogen atoms in the quinone residues.
When reacted with metal salts, polyaminooquinones
form polymeric complexes, of apparently chelate
structure. The EPR spectra and the magnetic sus-
ceptibility of aromatic polyaminooquinones and their

1959 [v. 1], no. 11, p. 1659-1666.

The free energy of the network of a swelled polymer was calculated by assuming as chain model the "pearl necklace" earlier employed in studies on the volume effects in polymerizations (Zhur. Tekh. Fiz. 28: 1437, 1958). The application of procedures from the theory of real gases is valid provided the correlation between the relative fluctuations of segment pairs decreases sufficiently rapidly with increasing distance between them. It is shown on a particular example that such a decrease does take place. The dimensionless free energy expansion factor is proportional to the mean number of segments (Chemistry--Organic, TT. v. 5, no. 11) (over)

Phenylacetylene and p-diethynylbenzene are capable of polymerization and copolymerization on heating at 150 to 400°C or at 70°C in the presence of complexes of an aluminum trialkyl and TiCl₄ or TiCl₃. On increasing the polymerization temperature of phenylacetylene from 150 to 300°C, there is an increase in yield, molecular weight and viscosity of polyphenylvinylene; at the same time the polymer color changes from yellow to brown (300°C) and black (400°C). Polymers of phenylacetylene and p-diethynylbenzene and their copolymers have narrow EPR signals, a large concentration of paramagnetic particles (10^{17} to 10^{19} particles/g) and a high value of (Chemistry-Organic, IT, v. 5, no. 3) (over)

HETEROCHAIN POLYESTERS. XXVI. SOME LAWS
GOVERNING POLYESTERIFICATION AT THE INTER-
FACE BOUNDARY. 27 Apr 60 [11]p. 13 refs.
Order from LC or SLA mi\$2.40, ph\$3.30 60-18472

Trans. of *Vysokomolekulyarnyye Soyedineniya* (USSR)
1960, v. 2 [no. 1] p. 61-66.

Some laws were investigated governing the polyesterification at the interface boundary. The yield of polyester and its reduced viscosity increase with an increase of the intensity of stirring of the reaction mixture. The highest molecular weight of polyester was obtained on adding a solution of isophthaloyl chloride in *p*-xylene to an aqueous alkaline solution of diane (0.1M concentration) during 11 minutes at about 20°C, when working with solutions of the starting substances with the same concentration. Trans. of Vysokomolekulyarnyye Soyedineniya (USSR)
1960, v. 2, no. 1, p. 82-84.

The synthesis, polymerization and copolymerization of 1-fluoro-1,1-dichloro- and 1,1-difluoro-1-chloropropylene-2 were accomplished by the dehydrochlorination from 1-fluoro-1,1,3-trichloro-propane and 1,1-di-fluoro-1,3-dichloro-propane, respectively. The copolymers of 1-fluoro-1,1-dichloro- and 1,1-difluoro-1-chloropropylene with styrene have glass transition temperatures higher than the glass transition temperature of homopolymers which is explained apparently by the formation of fluorine-hydrogen bonds between the polymer chains. DEGRADATION OF STEREOREGULAR POLYPROPYLENE. [1960] 5p. 3 refs.

Order from SLA m\$1.80, ph\$1.80 60-18426

Trans. of [Vysokomolekulyarnyye Soyedineniya] (USSR) 1960 [v. 2] no. 1, p. 130-132.

Experiments showed that polypropylene which is quite thermo-stable in a vacuum, undergoes an intense oxidative degradation on heating in the air. In the presence of oxygen there is observed no difference in degradation of the amorphous and crystalline polypropylene. Residues of titanium oxide which can be present in commercial samples of polypropylene obtained by means of Ziegler catalysts have no effect on polymer degradation. In order to inhibit the oxidative degradation of polymers it is necessary to use antioxidants which act weakly at room temperature. Di-(4-oxy-phenyl) sulfide especially strongly inhibits the oxidative degradation of polypropylene. (Author)

On the basis of the etching method used there were shown optical and electron microscopic studies of structures of microspherulites occurring in films of polyethylene sebacate obtained from solution. The separate coexistence in the microspherulite of polyethylene sebacate of crystalline and amorphous phases was established. The crystalline phase of the polymer is constituted of a helical-ribbon shaped packet of polymer chains composing the structural elements of the microspherulites themselves. The amorphous phase of the polymer consists of globular shapes not (Chemistry--Organic, TT, v. 5, no. 3) (over)

Abstract trans. of Vysokomolekulyarnyye Soyedineniya (USSR) 1960, v. 2, no. 4, p. 321-325

An organosilicon polymer with active ethoxy groups was synthesized by heterocondensation of methyl phenyl ethoxysilane chloride with phenyl triethoxysilane in a molar ratio of 1:0.5. The molecular weight of the polymer was 600-800, and the content of the ethoxy groups was 22.50%. The structure was assumed to be linear, with ethoxy groups situated both in the ends of the chain and as occasional side substituents. These active groups were then brought in contact with active hydroxyl end groups of polyethylsiloxanes. (Materials - Palma, T.I. v. 5, no. 4) (over)
